

Technology Stack Template

Date	27 October 2025
Team ID	NM2025TMID03953
Project Name	Lease Management System
Maximum Marks	4 Marks

Technical Architecture:

The Lease Management System is built entirely on the Salesforce Lightning Platform, combining both declarative tools (Flows, Process Builder, Validation Rules) and programmatic components (Apex Classes, Triggers).

Technology Stack- A Technology Stack is the integrated set of **software tools, frameworks, platforms, and programming languages** used to build, deploy, and maintain an application. It defines how both the **frontend** (user interface) and

backend (server-side logic, database management, and automation) components work together to deliver a complete system.

In the case of the **Lease Management System**, the technology stack leverages **Salesforce technologies** such as **Lightning App Builder**, **Apex**, **Flows**, and **Custom Objects**. These tools collectively create a **robust, secure, and scalable environment** that streamlines **lease management, tenant operations, and payment processing**, ensuring smooth automation and an enhanced user experience.

Category	Technology / Tool	Description / Purpose
Platform	Salesforce Lightning	The main development and deployment platform used to build and host the lease management application.
Backend Logic	Apex Classes & Triggers	Used to implement backend business logic, automate record updates, and manage system operations.
Automation Tools	Flows, Process Builder, Validation Rules, Approval Processes	Automate workflows, approvals, and data validation to reduce manual work.
Database	Salesforce Objects (Property, Tenant, Lease, Payment)	Custom objects used to store and manage all lease-related data.
Frontend / UI	Salesforce Lightning App Builder	Used to design an interactive and user-friendly interface with custom tabs and layouts.
Communication	Email Templates & Notifications	Automate communication between property owners and tenants for payments, approvals, and reminders.
Scheduling & Jobs	Apex Scheduler / Batch Apex	Executes scheduled tasks like monthly payment generation and automated reminders.
Security	Salesforce Role-Based Access Control (RBAC)	Ensures data protection by defining access levels for Admin, Owner, and Tenant users.
Testing Tools	Salesforce Developer Console / Apex Test Classes	Used for testing triggers, flows, and classes to ensure system reliability.
Version Control (Optional)	GitHub / Bitbucket	For tracking project updates and maintaining collaborative development.
